Review

The effectiveness of treatments for androgenetic alopecia: A systematic review and meta-analysis

Areej Adil BSc, Marshall Godwin MSc, MD

Background

Androgenetic alopecia, or male pattern **hair loss**, is a hair loss disorder mediated by **dihydrotestosterone**, the potent form of **testosterone**. Currently, **minoxidil** and **finasteride** are Food and Drug Administration (FDA)-approved, and HairMax LaserComb, which is FDA-cleared, are the only treatments recognized by the FDA as treatments of androgenetic alopecia.

Objective

This systematic review and meta-analysis assesses the efficacy of **nonsurgical treatments** of androgenetic alopecia in comparison to placebo for improving hair density, thickness, growth (defined by an increased **anagen** telogen ratio), or subjective global assessments done by patients and investigators.

Hair Loss

Hair loss is currently one of the most common “problems” dealt with by NHP behavioral management staff.

From: *Nonhuman Primates in Biomedical Research (Second Edition)*, 2012

Learn more about Hair Loss

Hair loss in women

Joseph E. Pizzorno ND, ... Herb Joiner-Bey ND, in *The Clinician's Handbook of Natural Medicine (Third Edition)*, 2016

Side effect of drugs

Hair loss concurrent with taking one of the drugs listed in the accompanying table does not indicate that the drug is the sole cause of hair loss. For **chemotherapy agents** (e.g., fluorouracil), the link is obvious. When medically appropriate, natural alternatives to suspected culprits should be used.

Diseases of Hair and Nails

Antonella Tosti, in *Goldman's Cecil Medicine (Twenty Fourth Edition)*, 2012

Hair Loss and Alopecias

Hair loss distresses most patients, independently from its severity and pattern. In some cases, the decrement in **quality of life** attributable to **hair loss** is comparable with that caused by major **chronic diseases**.

The first diagnostic step is to assess family history, drug intake, systemic illness, and severity and duration of **hair loss** (Table 450-1). The second step is to establish whether the hair density is normal or

Internationalization; Performance; Wood manufacturing industry; S-shape

1. Introduction

A quick look at the forest sector uncovers the increasing importance of internationalization in the industry, especially in recent years. [Foreign direct investment \(FDI\) \(Laaksonen-Craig, 2004\)](#) and the global export value (Zhang et al., 2014) have rapidly increased in the forest and wood manufacturing industry, and make internationalization a necessity in forest economic impacts of trade in the forest sector, international trade to be an important research substantially affects the global welfare of the sector internationalization as a widespread strategy for its consequences at corporate level has become of research outcomes has also led to a number of meta-analysis studies being published (e.g., Bausch and Krist, 2007; Marano et al., 2016). Unfortunately, this is not true in the case of the forest sector. Despite the obvious lack of

A combined focused industry and company size investigation of the internationalization-performance relationship: The case of small and medium-sized enterprises (SMEs) within the Swedish wood manufacturing industry

2. Theoretical frame of reference

2.1. Theoretical perspectives

I-P studies have mainly applied different mainstream theories such as **finance theory** of portfolio diversification, the **resource-based view**, **transaction cost** economies, and organizational **learning theory** to understand how internationalization affects company performance (Hennart, 2007; Tsao and Chen, 2010). However, again there is no consensus about the most suitable frameworks to decipher the relationship. In his seminal discussion, Hennart (2007) has critically evaluated the current arguments in the field and concluded that there is no theoretical basis for expecting a systematic I-P connection. However, he suggested transaction cost economies as an applicable rationale to explain the performance

Transaction Cost

Transaction costs are an important source of reluctance among farmers for adapting to future climate change, as understanding climate impacts and the uncertainty of such impacts may exceed the time and resources available to the farm manager.
